A PRODUCT OF NORTON COMPANY 

FORM 5316 rev9/00

WARRANTY

Norton Construction Products warrants all products manufactured by it against defects in workmanship or materials for a period of one (1) year from the date of shipment to the customer.

The responsibility of Norton Construction Products under this warranty is limited to replacement or repair of defective parts at Norton Construction Products' Gainesville, Georgia factory, or at a point designated by it, of such part as shall appear to us upon inspection at such point, to have been defective in material or workmanship, with expense for transportation borne by the customer.

In no event shall Norton Construction Products be liable for consequential or incidental damages arising out of the failure of any product to operate properly.

Integral units such as **gasoline engines, electric motors, batteries, tires, transmissions, etc.**, are excluded from this warranty and are subject to the prime manufacturer's warranty.

This warranty is in lieu of all other warranties, expressed or implied, and all such other warranties are hereby disclaimed.

Important: Before placing equipment in operation, record the following information.

MODEL: _____ **SERIAL NO.:** _____

PURCHASE FROM: _____

ADDRESS: _____

CITY: _____ **STATE:** _____ **ZIP:** _____

TELEPHONE NO. _____

***Before using this equipment, make sure that person using it
Read and understand the instructions in this owner's manual.***

I. PEPARATION

A. Assembly

Inspect the saw for shipping damage. If any damage is found, contact the shipper immediately and file a freight claim. The Norton Company is not responsible for any freight-related damages.

1. Remove machine from skid.
2. Remove band securing head in place. Remove packing material.
3. Raise cutting head from shipped position by using the hand wheel.
4. Remove the water pump and water pump bracket from carton. Clip water pump bracket to rear of pan and insert water pump into bracket.
5. Connect electrical outlet from water pump to electrical outlet rear of motor.
6. Attach water hose to water pump. Route water hose by passing hose behind pivot bar.
7. Remove the conveyer cart and guide from the carton and install on the pan.
8. Remove the drain plug from the carton and place in the drain hole opening located in the bottom of the pan.
9. Check the owner's manual for the wiring connection and the proper electrical hook-up before starting the saw.

I. PREPARATION

B. Electrical Connections

Important Before connecting the motor leads to the power supply, be sure that the voltage, cycles and phase shown on the nameplate of the motor correspond to the available power supply. All Clipper electric motors have overload protectors and are equipped with a reset button on the motor housing. If, after proper electrical connections are made, the motor will not run, press the reset button to the overload protector switch.

Electric Motors With Overload Protection

Power Connections

Connect the power supply to the pigtail leads of the switch. Direct wiring connection is preferred, but an extension cord with an electrical plug with 30 amp minimum capacity may be used. Connecting wires should be as short as possible and in one piece. In no case should the connecting wires be longer than shown in the following table for 5 h.p. single phase motors:

Wire Gauge	Length Of Wire		
	3 & 5 HP 230v 1PH	5HP 230/460v 3HP	7-1/2HP 230/460v 3HP
12	50'	-NA-	-NA-
10	100'	70'	-NA-
08	150'	110'	140'
06	-NA-	180'	200'

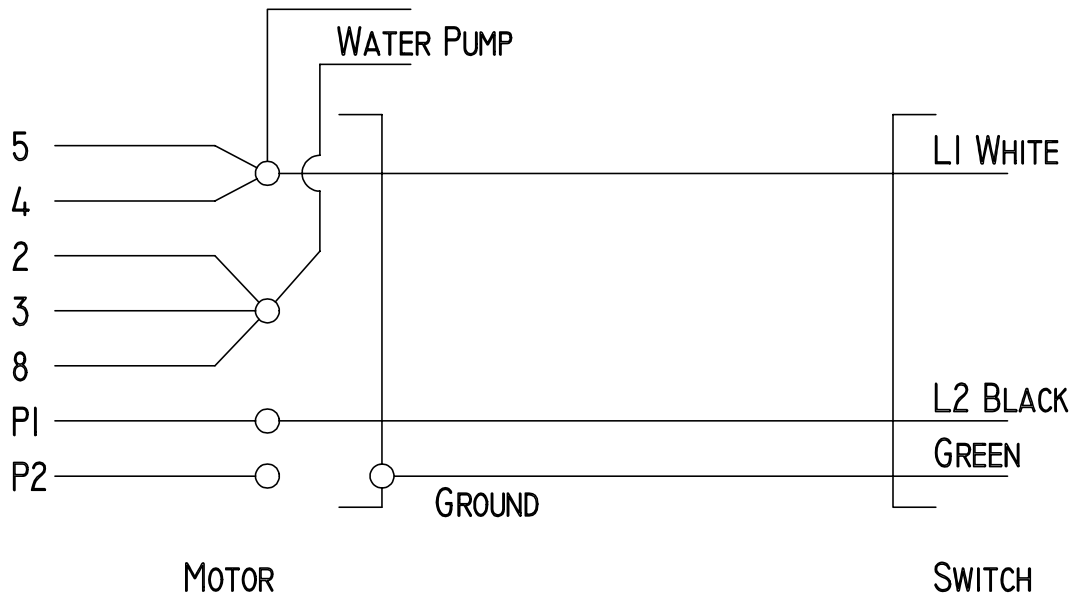

Caution-When wires that are too small gauge or too long are used, loss of power, over heating, or possible damage to the motor will result. -NA-= Do Not Use Wire Gauge For This Application, Motor Damage Will Occur and Will Not Be Covered Under Warranty

Ground Connection

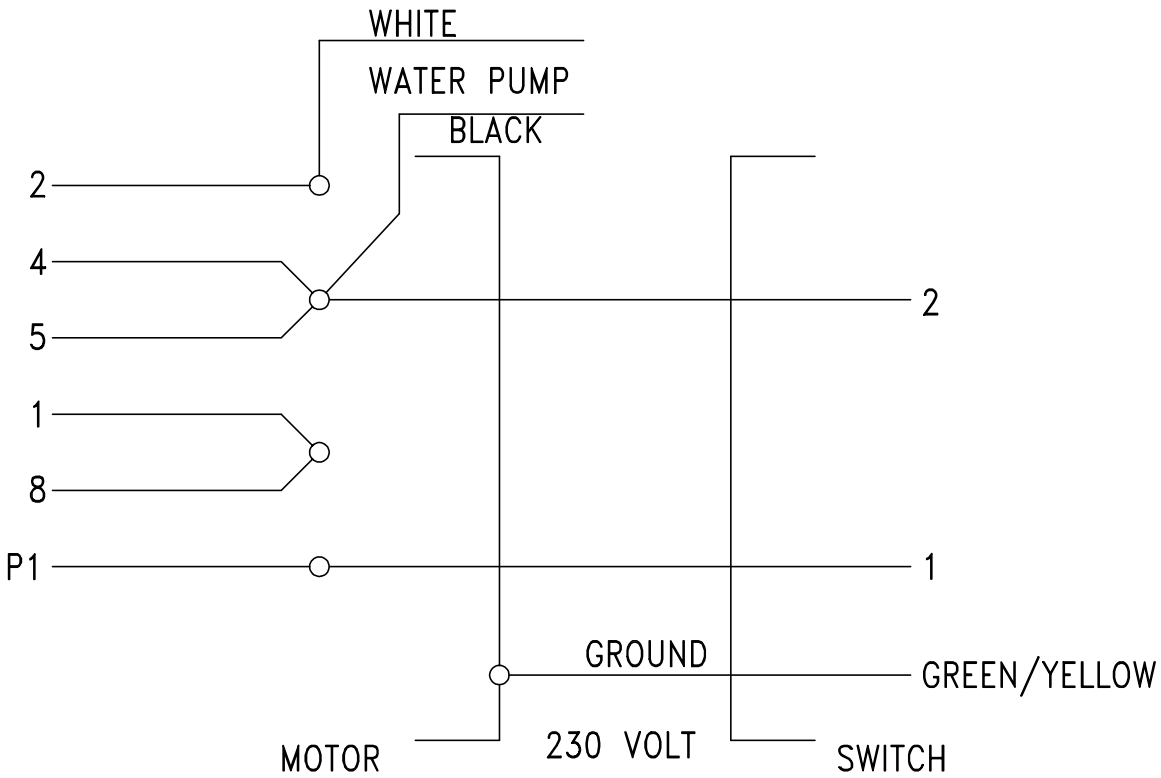

Be sure to ground the saw properly before operation. See professional licensed electrician for wiring and grounding assistance.

II. OPERATION

The best cutting speed and economy can be attained by following the instructions listed in this section and by selection of the right blade for the right job. Your local distributor can provide accurate blade recommendations to meet all cutting needs.

A. SAFETY PRECAUTIONS

Important: The following safety precautions must be observed.

1. Before mounting any blade on the saw, the blade should be inspected for any damage which might have occurred during shipment, handling or previous use.
2. The blade shaft collars and arbors should be cleaned and examined for damage before mounting the blade.
3. When tightening the blade retaining bolt against the outside blade shaft collar, be sure to tighten enough to hold the blade firmly without slipping, but do not over tighten.
4. Adequate coolant must be used for wet cutting abrasive and diamond blades.
5. The blade must be operated within the specified maximum operating speed.
6. The operator should wear safety glasses, ear plugs, dust mask, and any other appropriate safety equipment.
7. When starting the saw, the operator should stand away and to the side of the machine.
8. During cutting, the work piece must be held securely and prevented from twisting or slipping. The blade must not be forced into the material with excessive pressure.
9. The blade guard must always be in place before running the saw.
10. Make sure the lock pins are in place before running the saw.

Used Approved:

Head Protection

Hazard Symbols

fuel as a cleaning agent

Fuel (gasoline) is extremely flammable and its vapors can explode if ignited. Store gasoline only in approved containers, in well-ventilated, unoccupied areas approved, and away from sparks or flames. Do not fill the saw fuel tank while the engine is hot or running. Do not start the engine near spilled fuel. Never use the

Engine components can get extremely hot from operation. To prevent burns, do not touch the engine or related parts while the engine is running or immediately after it is turned off. Never operate the engine with any heat shields or guards removed.

Keep all guard in place when operating any piece of equipment

Keep hands, feet, hair, and clothing away from all rotating parts

Lethal Exhaust Gas use only in well ventilated areas. Engine exhaust gases contain poisonous carbon monoxide, which is odorless, colorless, and can cause death if inhaled. Avoid inhaling exhaust fumes, and never run the engine in a closed building or confined area

Never tamper with the governor components of settings to increase the maximum speed. Severe personal injury and damage to the engine or equipment can result if operated at speed above maximum. Always obey the maximum speed rating of blade.

II. OPERATION

B. How to Mount Blade

Be sure blade shaft collars and arbor are free of dirt and all foreign material before mounting blade on the arbor shaft. Tightening blade against an uneven surface can cause fracture of an abrasive blade or cause to run-out of alignment, causing excessive blade wear.

When tightening bolt against outside blade shaft collar, be sure to tighten enough to hold the blade firmly without slipping but do not over tighten -excessive tightening can cause fracture of abrasive blades.

Using blade shaft wrench (in bracket) remove the blade shaft bolt and loosen collar.

Place the blade on the arbor, and attach the loose collar and tighten the blade shaft bolt securely.

II. OPERATION

C. How to Use " Step Cutting " With Abrasive Blades

Use "step cutting" without exception when cutting wet or dry with abrasive blades.

"Jam cutting", which is discussed and illustrated in the section following, is to be used only with wet and dry cutting diamond blades.

1. Clamp and hold material firmly against the backstop on conveyor cart. Be certain the material does not slip or rock during cutting operation, as this can bind blade, causing excessive wear and fracture.
2. Move the conveyor cart near the blade, and pull down on the head until the blade is lowered to a point where it will lightly contact the top of the material. Then start "step cutting" which means passing the material beneath the blade with rapid, (50 to 60 strokes per minute) full length strokes, taking a shallow cut (approximately 1/8" deep) on the forward, and also on the backward stroke. Complete each rapid stroke backward and forward, by passing the material beyond the center of the blade before starting the reverse movement of the cart. The harder the material, the more rapid the forward and backward strokes.
3. "Step cutting as can be seen in the sketch below, lessens the area of the blade circumference in contact with the material, keeping the blade cool, running free, and cutting at peak efficiency. Don't get the impression "step" cutting means slow cutting - actually it is 6 times faster than trying to "force" the cut by strong arming the material through the blade. Forcing the blade through with a deep cut causes a longer area of the blade circumference to be in contact with the material, causing excessive friction heat to be generated, which then causes the blade to "smear, or "load" with fused material particles and lose its sharp cutting surface. *(Note: If improper operation should cause an abrasive blade to "smear", make several cuts through a soft brick to "dress" the blade back to good cutting performance.)*

II. OPERATION

D. How To Use "Jam Cutting" (Fixed Cutting) and "Step Cutting" With Diamond Blades

"Jam" cutting the head is locked in a fixed position and the material is pushed into it as shown in the sketch at the bottom. "Jam" cutting with the head locked in a fixed position usually provides greater efficiency.

1. To lock the head into position, tighten the lever nut at the back of the saw.
2. "Step" cutting with diamond blades is done by applying more pressure to the blade. Unlike "step" cutting with abrasive blades, "step" cutting with diamond blades requires only a few passes through the material.
3. In cutting, clamp the material securely and hold it firmly against the conveyor cart backstop. If the material is allowed to slip, resulting seizure of the blade may bend the diamond blade steel center or cause a tin section to be twisted off.
4. Do not force the material or bump into the blade. When nearing completion of the cut, retard and slightly hold back the conveyor cart. If this is not done, the material may be pulled into the blade so fast that excessive pressure on the rim may cause warping or twisting of the rim section.
5. When a new diamond blade is broken in, make the first few cuts slowly until the blade cuts freely and easily.
6. When the blade is cutting freely and easily. Use it! As long as it cuts satisfactorily do not dress the diamond blade or remove it from the blade shaft.
7. After continuous cutting of extremely hard and dense materials, the blade may slow down and it may be necessary to "dress" the cutting edge. To do this:
 - a. Use a rapid "step" cutting method for a few cuts push the material back and forth under the blade while it is cutting down. If this is not sufficient:
 - b. Make one or two cuts in a soft brick or lightweight block.

However, "dressing" should be done as seldom as possible - because too much "dressing" reduces blade life.

II. OPERATION

E. How To Use For Dry Cuffing

1. Use a proper blade, which is marked for dry cutting.
2. Remove the water curtain.
3. Disconnect the water pump.
4. Use "step" cutting as explained previously when using abrasive blades.
5. Use "jam" or "step" cutting when using dry cutting diamond blades.

F. How To Use For Wet Cutting

Water may be supplied either by filling the water pan to within a half-inch of the top (for continuous use of the same water) or by placing a barrel of water next to the saw (for continuous flow of clean water). When using water from a barrel, remove water from pan and submerge it in water barrel. Remove the drain plug so the used water and sludge will drain from pan.

1. Prepare water supply.
2. Install water curtain on cutting head pivot bar.
3. Be sure the water pump is plugged into the receptacle on the back of the masonry saw motor. (The pump will start when the main switch is turned on.)
4. Handle on petcock should be turned in line with the water flow. Start motor and be certain that both sides of the blade are getting water.
5. Be sure that the water covers the near the bottom of the pump at all times. Do not let sludge and dirt get deep enough in the pan to block the pump inlet.
6. Use "step" cutting with abrasive blades as previously directed.
7. Use "jam" cutting or "step" cutting with diamond blades as previously described.

III. MAINTENANCE

The saw requires very little maintenance for long satisfactory operation. However, the following points must be watched:

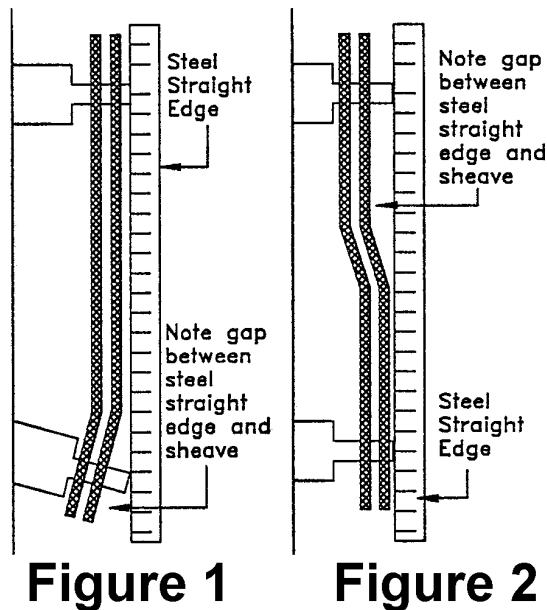

A. V-Belts

The drive belts are made of premium oil and heat resistant materials. They require very little adjustment, but should be tightened after the first few days of running.

Adjustment and Alignment

Warning: Never make adjustments to v-belts and pulleys while engine is running.

1. The best tension for a v-belt drive is the lowest tension at which the belts will not slip under full load.
2. Simply take up the drive until the belts are snug in the grooves. Run the drive for about 15 minutes to "seat" the belts. Then impose the peak load. If the belts slip, tighten them until they no longer slip at peak load.
3. Remember, too much tension shortens belt and bearing life.
4. Check belt tension frequently during the first day of operation. Check belt tension periodically thereafter and make any necessary adjustments.
5. The two most common causes of misalignment are shown in the drawing.
 - a). The engine drive shaft pulley and the blade shaft are not parallel. See figure 1
 - b). The pulleys are not located properly on the shafts. (See figure 2)
6. To check alignment, all you need is a steel straight edge.
7. Line up the straight edge along the outside faces of both pulleys as shown in the drawing.
8. Misalignment will show up as a gap between the pulley face and the straight edge.
9. Make sure that the width of the outside land is equal on both pulleys.

III. MAINTENANCE

B. Motor

The motors are specially designed for masonry sawing. It is totally enclosed and the sealed bearings require no lubrication. The motor is equipped with thermal overload protection.

1. Periodically clean the dirt and sludge build-up from the motor fan housing and cooling fins.
2. If the motor becomes overheated, the protector shuts the motor off. Turn the motor switch to the "OFF" and identify the cause of overheating.

Engine

1. Refer to the engine owner's manual for complete maintenance.
 - a. Pre-cleaner: every 25 operating hours, more often in dusty or dirty conditions, wash and oil the pre-cleaner.
 - b. Paper Element: Every 100 operating hours, more often under dusty or dirty conditions clean the paper element.
 - c. Engine Oil: After the first month or 20 operating hours, change the oil, then every 6 months or 100 operating hours.

C. Blade Shaft Bearings

The blade shaft bearings are lubricated and should not require daily relubrication under normal conditions. However, to assure long life the bearings do need to be relubricated periodically. The time interval between greasing is dependent on the running speed and operating conditions. The following chart covers most situations and can be used as a guide.

Temperature	Cleanness	Greasing Interval
Up To 150°F	Dirty	6 to 12 Months
Over 150°F	Dirty	Daily to 2 Weeks
Any Temperature	Very Dirty	Daily to 2 Weeks
Any Temperature	Extreme Conditions	Daily to 2 Weeks

Note: Never operate saw without bearing cover in place.

For normal conditions the grease should conform to the NLGI grade two consistency and be free of any chemical impurities such as free acid or free alkali, dust, rust, metal particles or abrasives. For best results, the bearings should be relubricated while in operation.

Note: Due caution for personal safety must be observed when servicing rotating equipment.

The grease should be pumped in slowly until a slight bead forms around the seals. This bead, in addition to acting as an indicator of adequate relubrication, provides additional protection against the entry of foreign matter.

III. MAINTENANCE

C. Blade Shaft Bearings

If necessary to relubricate while the bearing is idle, refer to relubrication table for the maximum grease capacity for the bearings.

Relubrication Of Sealmaster Bearings	
Shaft Size	Maximum Grease Capacity of Bearing Chamber In Ounces
7/8" to 1-3/16"	1/4

D. Pump

The submersible pump is equipped with a thermal overload protector and the sealed bearings require no relubrication. The pump is designed to run wet or dry, but for continued dry cutting, disconnect the pump.

1. Be sure to keep the pump clean do not allow sediment to cake in the pump and clog it.
2. Keep all lines clean and running free.

V. PARTS LIST SECTION

A. Ordering Information

1. List model number and serial number of machine.
2. List the part number and description of part (not item number).
3. Whenever alternate parts are shown due to product improvement, inspect the part you have and provide additional description as necessary.
4. Specify mode of shipping desired, for example, parcel post, truck, air freight, U. P. S., best way, etc.

B. Parts List

See assembly drawing.

C. Power Unit Service Information

Repair or replacement service is available from your nearest authorized service station. Refer to the service center listing for the nearest authorized motor/engine service center.

AUTHORIZED SERVICE CENTERS

AC and DC Lines

Service Procedure

When a MagneTek motor requires service, it should be shipped (transportation prepaid) to the nearest MagneTek Authorized Service Center listed herein.

Attach a tag to the motor listing the following information.

1. Name and address of the owner.
2. Dates of installation and removal.
3. Voltage applied to the motor.
4. Name of the equipment manufacturer.

5. A brief statement of the trouble.

6. Complete instructions for return shipment.

MagneTek Authorized Service Center operators are trained, skilled and experienced in motor repair. They are equipped to repair motors efficiently using factory replacement parts. They are authorized to perform warranty service on MagneTek motors.

Freight cost is not allowed regardless of warranty status. Repaired motors will be shipped freight collect unless other arrangements are made with the repairing agency.

Legend

AC Motors

- 000—Horsepower Rating
- *—U.L. Listed for Repair of Explosion-Proof Motors
- BOLD PRINT—MagneTek Distributor
- 1—Random Wound Motors (Century® Industrial)

DC Motors

- 2—Indiana General

MagneTek's liability shall be limited to the cost of repairing or replacing any defective motor.

MagneTek's warranty does not apply if the failure is caused or contributed to by any of the following: improper handling; improper storage; improper installation; abuse; unsuitable application of the motor; lack of reasonable and necessary maintenance or repairs made or attempted by other than MagneTek, or its assigns, which in the judgement of MagneTek, adversely affects the motor's performance or reliability.

In order to determine if the warranty applies, the motor must be delivered or shipped freight prepaid to the nearest MagneTek Authorized Service Center or returned freight prepaid (after proper authorization) to the plant of manufacture.

A PRODUCT OF NORTON COMPANY

NORTON

WARNING

Some dust created by power sanding, sawing, grinding, drilling, and other construction activities contains chemicals known to cause cancer, birth defects or other reproductive harm. Some examples of these chemicals are:

- **Lead from lead-based paints,**
- **Crystalline silica from bricks and cement and other masonry products, and**
- **Arsenic and chromium from chemically-treated lumber.**

Your risk from these exposures varies, depending on how often you do this type of work. To reduce your exposure to these chemicals: work in a well ventilated area, and work with approved safety equipment, such as those dust masks that are specially designed to filter out microscopic particles.
